

BIO ACTIVATOR

Enhances plant operation, settlement and BOD removal

- A concentrated blend of liquid nutrients– in the right proportions
- Designed for application in all types of biological effluents that may be deficient in a base food source.
- Provides Macro and Micro Nutrients
- Technical support available
- Improves settle ability, reduces suspended solids

Bio Activator is supplied in a soluble complexes form which ensures instant, uniform mixing with waste-water.

Bio-Activator contains the proper balance of macro/micro nutrients which would be required in a form readily available for microbial uptake. The product assists by improving dissolved Oxygen transfer and accelerating degradation by speeding digestion. Unlike other nutrient additives, it does not rely on phosphoric acid and urea addition. These products are inexpensive but are not as readily available to an under-developed biomass.

Bio Activator contains a blend of nutrients and trace elements. These are proportioned to the biological requirements of the plant. Because the product is blended at our premises, we can change the specification to the needs of the individual client. User guide 1 ltr to approximately 500kgs BOD
