

ECO SEPTIC

KEEPING SEPTIC TANKS TROUBLE FREE

HOW SEPTIC SYSTEMS WORK.

Waste flows from your house to your septic tank, where natural bacterial action break down wastes and prevents the tank from backing up. Only overflow water should reach the field lines where it evaporates. Septic systems today differ from systems of 50 years ago because they have to deal with whole load of extra chemicals. Detergents, bleaches, sanitizers, disinfectants and harsh chemicals, while beneficial to our health and hygiene, interfere with natural biological action that makes septic systems work. When biological action is reduced, grease and sludge begins to build up until it eventually clogs the system and causes it to back up.

HOW ECO SEPTIC TREATMENT WORKS.

ECO-SEPTIC Septic Tank Treatment contains a concentrated blend of specially selected bacteria that restore biological action to keep tanks functioning properly. Just flushing Eco Septic down the toilet will add beneficial bacteria to the system. This keeps solids from reaching the drain lines and causing sewage backup. Regular treatment will reduce the build up of greases and harmful sludge in septic tanks and drain

Regular treatment will keep your system working properly

- * **Safe & Easy to use** * **Environmentally Friendly**
- * **No Caustics or Acids** * **Non-Corrosive & Non-Flammable**
